Finishes

PPC (Polyester Powder Coating) Polyester powder coating involves the electrostatic application of dry powder onto a substrate, followed by heating to melt the powder, creating a protective layer around the material. This method offers superior durability compared to traditional wet paint, and it eliminates the need for solvents during application. Typically presenting a smooth finish with various gloss levels, polyester powder coating also offers textured finishes that create the illusion of a lower gloss level if desired.

Available on steel and aluminum.

Custom PPC Custom PPC's are powders crafted to replicate specific materials, such as high gloss and anodic effects. For more information, please feel free to inquire.

Available on steel and aluminum.

Performance PPC Performance PPC's are specifically engineered for use in corrosive environments. Through specialized powder formulations and additional application processes, the coating is fortified to endure harsh conditions.

Available on steel and aluminum.

Anodised Anodising is the aluminum finishing process that involves the application of electrical currents, resulting in an altered aesthetic and enhanced resistance to corrosion.

Available on aluminum only.

Timber Effect Timber effect finishes offer an authentic timber look while having the advantages of metal, such as, product stability, lighter weight and fire performance.

Available on steel and aluminum.
